

ARE YOU CONCERNED ABOUT FORGETFULNESS OR YOUR MENTAL ABILITIES?

We invite you to participate in a study of the evaluation of concerns with forgetfulness or other cognitive concerns, such as difficulty with attention and concentration.

Cognitive concerns are common, and they may cause worry about serious cognitive problems. However, these concerns do not always mean there is a serious problem, and it is important to distinguish concerns that are part of serious cognitive problems from concerns that are part of normal aging. The purpose of this study is to study how well short tests can detect cognitive problems among persons with cognitive concerns attending primary care practices.

You are eligible to participate if you:

- Have cognitive concerns, such as forgetfulness, or difficulty with attention or concentration.
- Are between 65 and 99 years of age and have medical insurance.
- Attend a primary care practice in New York City.
- Have NO known diagnosis of a cognitive problem, such as dementia, including Alzheimer's disease.

Participation will include:

1. Questionnaires and cognitive tests.
2. Blood tests.
3. Cognitive evaluation by the study physician.

We will compensate your time for completing all study procedures with \$160. We will also provide you with your blood test results and the diagnosis of the cognitive evaluation.
